Agenda

- What is Flatcar Container Linux
- The UX philosophy
- Immutable by design
- A/B updates and channels
- Live demo
- Try it today

Part I

What is Flatcar?

Flatcar in one slide

- **Minimal, immutable Linux** built for running containers
- **Automatic atomic updates** — no in-place package upgrades
- **Runs anywhere** — bare metal, all major clouds, edge
- **CNCF Incubating project** since August 2024

“*The operating system as an implementation detail.*

— attributed to the CoreOS founders

Default content slide

The unclassed slide uses a **white background** with a **navy title bar** carrying the Flatcar logo. Use this for most of your content.

- Bullets get a cyan `::marker`
- Inline `code` gets a light grey pill
- **Bold** `**text**` stays ink-navy

```
# Fenced code blocks get a cyan left rule
variant: flatcar
version: 1.0.0
```

Lead slide

Full-bleed navy — use for a single big statement.
